In this day and age social media is filled with friend's political leanings. Eventually anyone who uses the internet is going to want to filter opinions they're sick of hearing. Rather is a web application that allows users to filter images and topics they do not want to see on Facebook and Twitter and replace it with images they do want to see. Our intended user is anyone who uses the social media sites Twitter and Facebook and wants to filter what they see on their feed.

The filtering of what you see online is really important for anyone but in particular it's important for sensitive users. If someone suffers from a condition like PTSD social media can trigger these horrific memories. With the use of rather this user can filter away things like gun violence and instead replace it with a soothing image of puppies. This makes it even easier to see the things we don't want to and instead see things we want to see more of. This software is intended to be used on personal computers that run Google chrome. Rather will have features that allow users to un-filter favourite users whose opinions they do want to see. This makes it even easier to see only things you want to see.
